HOW TO USE CHART

VOLUME REDUCTION can be determined two ways, weight and volume. Weight can only be measured after an on-site test using the **PAK-MORE**. For purposes of this illustration, a conservative estimate of 20 to 40 percent could be used. The heavier the material to be compacted, the more accurate the figure will be.

Volume can be estimated for materials that are relatively light in weight and mass. Compact a full drum and measure the distance of springback after the compaction head has returned. This distance divided by the height of the drum (35-inches) will give you the estimated percentage the **PAK-MORE Hold-Down Disk** will increase the volume in the drum. Because you can expect a certain amount of springback immediately after the pressure is released, in use, the numbers will improve.

Determine your DISPOSAL COST PER DRUM and go down to the estimated VOLUME REDUCTION figure. This is your savings per compacted drum *after* the cost of the **PAK-MORE Hold-Down Disk**. This figure assumes you use (2) **PAK-MORE's** per drum @ \$26.56 each (calculated when buying a skid of 25 disks). Multiply this figure by the number of compacted drums per year your facility generates for an annual savings amount.

THINGS TO ALSO CONSIDER

- ✓ Fewer drums needed to buy & store
- ✓ Less labor due to fewer drums to compact
- ✓ Smaller holding facility needed for decay storage
- ✓ Waste Hauler surcharges for heavier drums
- ✓ Volume discounts for larger **PAK-MORE** purchase
